

I am an interstate truck driver. I enjoy XM Radio the entire time I am out on the road. It provides a variety of stations that I would not be able to get if I were to depend on regular radio stations. I can listen to one station for hours and never lose the signal. The digital signal makes the sound quality superb. The weather and traffic news helps me to avoid hazardous areas and allows me to choose alternate routes anytime day or night. I consider this a safety issue. Why would the NAB want to take this from satellite radio when this could protect motorists from potential accidents. If it saves one life, it is worth it. You would only get this information once or twice a day or on certain hours from regular radio.
